CAPSTONE 1: Debug Portfolio

HTML Errors

The HTML files had many errors and missing lines of code. The correct CSS file was not linked in the head element. In the body element, the semantic tags used were not correct. The Header element was incorrectly named ‘div class=”header” ’ in the 8th row of the code. Only div tags had been used throughout the document instead of the use proper semantic tags. None of the pages had a navigation menu. There were no images being referenced in any of the files, and they did not have and descriptive alt text for accessibility.

I started off by linking the correct CSS file to the page so that the styles could take effect. I used <header>, <nav>, <main>, <section> and <footer> tags, instead of ‘div class’, to allow for structure and accessibility. I added a navigation menu and renamed the footer and header elements. I added images and descriptive alt text for those images. I also added a table to the ‘about me’ page.

In the form tag, the inputs did not show what information was supposed to be typed in. They were also different sizes and were not neatly structured. All the form inputs were missing labels, which made the website less accessible and less user-friendly. The formats of the input elements were incorrect, and there were missing attributes. There was no id or name attribute. The input type for email and the button tag were also incorrect. The different inputs did not have div tags separating them.

I used the correct syntax for the different form inputs and the button element and added labels to each form input. I separated the forms with div tags. Added more input types to the form, with additional validation inputs.

CSS Errors

The header and footer class selectors were missing proper alignment. The navigation menus, the form and table had no styling. There is poor colour contrasting for the hero class. The hero image width was set to 100%. There were less than 5 selector types and no pseudo classes or combination selectors. There is no box model demonstration. There is inconsistent spacing in the code. There are no CSS comments. There is no variety in text and colour styling.

I added proper alignment to the header and footer class selector. I styled the navigation menu, the form and the table. I added colour to different elements of the page, and added more selector, pseudo classes and combination selectors. I added bow model properties, CSS comments, and formatted the document for proper spacing. I rectified the sizing of different elemnts.
